Research:

My research focuses on the development and application of theoretical, computational and experimental techniques to characterize the response of materials and structures to mechanical, thermal, and environmental loads. I am particularly interested in characterizing the mechanics of fatigue and fracture. My multidisciplinary research, which has been funded by the **National Science Foundation**, **DARPA**, the **National Institutes of Health**, the **Office of Naval Research**, the **United States Air Force**, **NASA** and the **Ohio and Minnesota Departments of Transportation** has been applied to problems arising in civil engineering, mechanical and aerospace engineering, materials science, electromechanical systems, biological tissues and prosthetic design. I have published more than one hundred papers in the top refereed journals, including **Science** and **Nature**, and several of my research projects have been featured in the popular press, including the **New York Times**, **Science Times**, **American Scientist**, **Science News**, **Business Week**, **Financial Times**, **Geo**, **Pour La Science** and **Industry Week**.

My current research involves multiscale-time-dependent progressive collapse of reinforced concrete structures, stochastic modeling of the effects of imperfections on buckling of plates and shells, bioinspired design of damage tolerant composites, reliability of microelectromechanical systems (MEMS) devices, structural testing of nanoscale biological and synthetic materials such as collagen fibrils, carbon nanotubes and MEMS materials, computational materials science, multiscale modeling of heterogeneous materials, the design and testing of a new earthquake

energy dissipation system for steel structures, size effects in quasibrittle materials, statistical strength distributions in glass and other types of ceramics.
